

ECONOMIC DEVELOPMENT & PLANNING | INDUSTRIAL DEVELOPMENT AGENCY | LOCAL DEVELOPMENT CORPORATION

Tioga County Industrial Development Agency October 6, 2021 – 4:30 pm Ronald E Dougherty County Office Building 56 Main Street, Owego, NY 13827 Hubbard Auditorium, 1st Floor Agenda

I. Call to Order and Introductions

II. Attendance

IDA Board Members

Roll Call: J. Ceccherelli, K. Gillette, T. Monell, M. Sauerbrey, J. Ward, E. Knolles, A. Gowan
Excused:
Guests: C. Curtis, M. Griffiths, J. Meagher, L. Tinney

III. Privilege of the Floor:

Elaine Jardine, Planning Director and Pete DeWind, County Attorney

Jason Bellis, Larson Design Group Wetland Delineation Report

IV. Approval of Minutes

- A. September 1, 2021 Regular Meeting Minutes
- B. September 30, 2021 Loan Committee Meeting Minutes

V. Financials

- A. Balance Sheet
- B. Profit & Loss
- C. Transaction Detail

VI. ED&P Update: L. Tinney

A. Village of Owego Grants & Investment

VII. Project Updates: L. Tinney & C. Curtis

A. Owego Gardens II

1. Updated Project Cost Spreadsheet

- B. STREDC Shovel Ready Loan
- C. DOL Notice

VIII. Committee Reports: C. Curtis

A. Public Authority Accountability Act (PAAA)

- 1. Audit Committee Report: A. Gowan, E. Knolles, J. Ward a. No report
- Governance Committee: J. Ceccherelli, A. Gowan, E. Knolles
 a. No report

- F. Soils Report

1.0 INTRODUCTION

Larson Design Group (LDG) has been retained by the Tioga County Industrial Development Agency to complete an aquatic resource delineation on two parcels of land located in the Town of Owego, Tioga County, NY (See Project Location Map). The parcels include the Rizzuto Property (TM#129.00-1-2.1); aka "Site #1", which is approximately 38.81 acres, and a portion of the TCIDA Property (TM#12900-1-3.1); aka "Site #2", which is approximately 36 acres. Located just south of I-86 and the Susquehanna River, the parcels are situated in a residential area north of Strong Road, with nearby industrial and commercial development. The area of investigation included approximately 38.81 acres of woodlands (Site #1) and an open, unmaintained, 36-acre field (Site #2). The woodlands are largely undisturbed, while the field displays signs of previous agricultural activity. Density and diversity were normal throughout the investigative area. LDG evaluated the area of investigation (AOI) for the presence of wetlands and watercourses on August 25th, 2021.

The following sections document the protocol used in determining the occurrence of wetland and watercourse habitats, current site conditions, and the results of the investigations.

2.0 METHODOLOGY

The wetland delineation was conducted in accordance with the 1987 U.S. Army Corps of Engineers Wetlands Delineation Manual and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Regional Supplement 2012.

Based on USACOE Protocol, the following criteria are required for an area to be considered as wetland habitat:

- hydrophytic vegetation
- hydric soil
- wetland hydrology

The presence of these three parameters is mandatory under normal field conditions for an area to be classified as a wetland. In areas where one or more of these parameters are disturbed, a determination is made as to whether the three criteria would be present under normal circumstances. During this investigation, identified wetlands were flagged with pink wetland delineation flagging and labeled.

Vegetation, soils, and hydrology were documented at sampling points throughout the study area. The information obtained at sampling points was documented on data forms as per the 1987 USACOE Manual Protocol (See attached Data Forms in Appendix D).

The stream delineation and classification were conducted in accordance with the *New York State Department of Environmental Conservation; Hudson River Estuary Program Streams 101* stream flow definitions. This webinar series and online document provides environmental regulatory guidance on how to properly classify waters in New York State. The following conditions were considered by Larson Design Group when identifying stream types:

- Geomorphic features
- Hydrologic features

Biological features

The presence/ absence of continuous stream flow establishes the geomorphic, hydrologic, and biological characteristics of streams. Stream determinations were made by examining a stream reach to properly designate the watercourse. The following parameters were taken into consideration during the evaluation: water source, defined bed and bank relationship, type of substrate, stream processes and stream stability, and macroinvertebrate/ aquatic life.

3.0 BACKGROUND INFORMATION

3.1 Site Description

The project area consists of two parcels of land comprised of woodlands and an open, unmaintained field. The woodlands account for 38.81 acres and are largely undisturbed, while the approximately 36-acre field shows signs of previous agricultural activity. The project area is on relatively flat to moderate terrain with normal vegetative density and diversity. Vegetation within the field consists mainly of herbaceous and shrubby vegetation, while the woodlands contain a mix of pines and hardwoods. The surrounding land is comprised mostly of residential properties.

3.2 Soils Information

The NRCS Web Soil Mapper identified seven (7) soil types within the investigation area as shown in Table 1.

NAME	MUSYM	SLOPE	HYDRIC RATING
Chippewa channery silt loam	Cc	0 to 8%	92
Mardin-Volusia complex	Cdr	8 to 15%	3
Mardin-Volusia complex	Cdu	0 to 8%	5
Lordstown flaggy silt loam	Lfv	45 to 60%	0
Mardin channery silt loam	Mcu	0 to 8%	0
Volusia channery silt loam	Vcl	0 to 8%	5
Woostern gravelly silt loam	Wh	16 to 25%	0

TABLE 1: SOILS WITHIN THE PROJECT AREA

Please refer to the attached Soils Report for additional information pertaining to the soils in the project area. Soils information specific to the identified wetlands is located within Section 4.1 of this Report.

3.3 National Wetlands Inventory Status

The National Wetlands Inventory (NWI) was reviewed to determine whether any NWI wetlands were located within the area of investigation. The NWI Program under the U.S. Fish and Wildlife Service (FWS) is responsible for the mapping and inventory of major wetlands within the United States. The FWS Wetlands Mapper (<u>http://www.fws.gov/Wetlands/Data/Mapper.html</u>) was used to review NWI wetlands within the area of investigation. Based on FWS Wetlands Mapper, no wetlands were mapped within the AOI, but a freshwater pond was established just outside of the western boundary of the AOI. A map of the project area from the FWS Wetlands Mapper is located in Appendix C.

3.4 Watershed and Stream Designations

This project is located within both the Owego Creek and Susquehanna River watersheds. No streams were identified within the project area. The New York State Department of Environmental Conservation, Waterbody Classification for Streams/Rivers (Environmental Resource Mapper (ny.gov) was used to review stream designations within the area of investigation.

4.0 **RESULTS**

The field investigation revealed the presence of two (2) wetlands within the investigative area. These aquatic resources are shown in the attached Delineation mapping. Identified aquatic resources are listed in Table 2 below.

TABLE 2: IDENTIFIED AQUATIC RESOURCES: WETLANDS AND STREAMS

WATERS NAME	COWARDIN CODE	HGM CODE	WATERS TYPE	DELINEATED AREA (AC/LF)
Wetland 1	PEM1	DEPRESS	DELINEATE	0.089 AC
Wetland 2	PEM1	DEPRESS	DELINEATE	0.119 AC

ACRONYMS

PEM1 – Palustrine Emergent Persistent Wetland

4.1 Identified Wetlands

During the investigation, two (2) wetland habitats were identified within the investigative area. Descriptions of the identified wetlands are listed below.

Wetland 1 is a PEM1 depressional wetland located on the edge of a field in the northwest corner of Site #2. The wetland is formed from improper drainage downslope due to disturbance. The common plants within this wetland consist of Flat-Top Goldenrod (*Euthamia gramnifolia*), Arrow-Leaved Tearthumb (*Persicaria sagittate*), Sensitive Fern (*Onoclea sensibilis*), Allegheny Blackberry (*Rubus allegheniensis*), and Chufa (*Cyperus esculentus*). The soils in the diagnostic soil horizon exhibited hydric conditions based on the Loamy Gleyed Matrix (F2) hydric soil indicator. Wetland hydrology observed at the time of investigation consisted of Saturation (A3).

Wetland 2 is a PEM1 depressional wetland located in the southeast corner of Site #2. The wetland is sustained by a groundwater seep on the northern section of the wetland. The common plants within this wetland consist of Rough Goldenrod (*Solidago rugosa*), Giant Goldenrod (*Solidago gigantea*), Flat-Top Goldenrod (*Euthamia gramnifolia*), Bird's Foot Trefoil (*Lotus corniculatus*), Reed Canary Grass (*Phalaris arundinacea*), Fox Sedge (*Carex vulpinoidea*), and Soft Rush (*Juncus effusus*). The soils throughout the soil profile exhibited hydric conditions based on the Depleted Matrix (F3) hydric soil indicator. Wetland hydrology indicators observed at the time of investigation consisted of Saturation (A3).

4.2 Watercourses

During the investigation, no streams were identified within the AOI.

5.0 CLOSING REMARKS

This report presents an unverified Jurisdictional Determination of the project site based on the author's scientific opinion. All work was done in accordance with the 1987 U.S. Army Corps of Engineers Wetland Delineation Manual and the Northcentral and Northeast Regional Supplement. Any impacts to identified wetlands may require state and/or federal permitting. Prior to any disturbance of aquatic habitats, authorization must be obtained from the United States Army Corps of Engineers and/or the New York State Department of Environmental Conservation.

6.0 LIST OF PREPARERS

Kenneth Stockert – Senior Project Manager, Larson Design Group

Education: B.S. Environmental Resource Management, The Pennsylvania State University Experience: 30 years environmental consulting; 3 years as Instructor for Wetland Delineation at the Community College of Allegheny County Training: Wetland Delineation using the USACOE 1987 Methodology Role in Project: Report Preparation Contact Information: kstockert@larsondesigngroup.com or (724) 528-0392

Robert Cawthern, Senior PWS – Senior Environmental Specialist, Larson Design Group

Soils Report

United States Department of Agriculture

Natural Resources Conservation Service A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for **Tioga County**, **New York**

Tioga County Industrial Development Agency

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/? cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

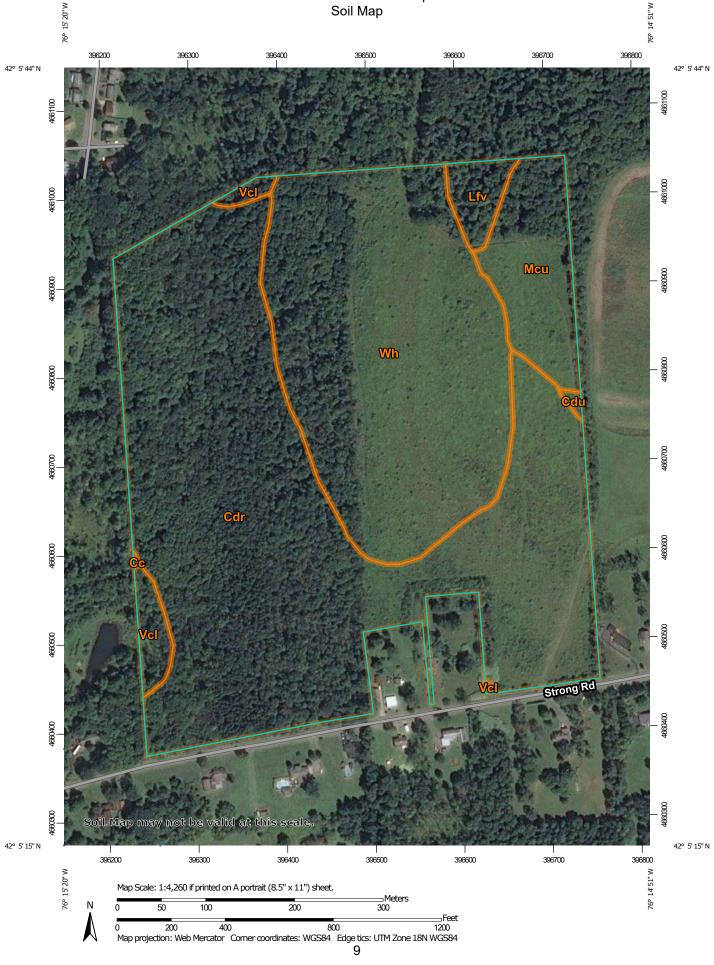

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

Map Unit Legend

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit

descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Tioga County, New York

Cc-Chippewa channery silt loam, 0 to 8 percent slopes

Map Unit Setting

National map unit symbol: 2vcjc Elevation: 330 to 2,460 feet Mean annual precipitation: 31 to 70 inches Mean annual air temperature: 39 to 52 degrees F Frost-free period: 105 to 180 days Farmland classification: Farmland of statewide importance

Map Unit Composition

Chippewa and similar soils: 85 percent Minor components: 15 percent Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Chippewa

Setting

Landform: Depressions Landform position (two-dimensional): Toeslope Landform position (three-dimensional): Base slope Down-slope shape: Concave Across-slope shape: Concave Parent material: Loamy till dominated by siltstone, sandstone, and shale fragments

Typical profile

Ap - 0 to 7 inches: channery silt loam *Eg - 7 to 15 inches:* channery silt loam *Bxg - 15 to 45 inches:* channery silt loam *C - 45 to 72 inches:* channery silt loam

Properties and qualities

Slope: 0 to 8 percent
Surface area covered with cobbles, stones or boulders: 0.0 percent
Depth to restrictive feature: 8 to 20 inches to fragipan
Drainage class: Poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.14 in/hr)
Depth to water table: About 0 to 6 inches
Frequency of flooding: None
Frequency of ponding: None
Calcium carbonate, maximum content: 15 percent
Available water supply, 0 to 60 inches: Low (about 3.1 inches)

Interpretive groups

DRAFT

Tioga County Industrial Development Agency September 1, 2021 – 4:30 pm Ronald E Dougherty County Office Building 56 Main Street, Owego, NY 13827 Hubbard Auditorium, 1st Floor Agenda

I. Call to Order and Introductions- Ms. Ceccherelli called the meeting to order at 4:32 pm.

II. Attendance

IDA Board Members

Roll Call: J. Ceccherelli, K. Gillette, T. Monell, M. Sauerbrey, J. Ward, E. Knolles (attended via Zoom), A. Gowan (attended via Zoom) Absent:

Excused:

Guests: C. Curtis, M. Griffiths, J. Meagher, L. Tinney

III. Privilege of the Floor: Jason Bellis, Larson Design Group

Mr. Bellis presented the board with maps showing the potential development at the nine-acre site on Buck Road in Lounsberry. Mr. Bellis' design proposed a phased approach, starting with one building and then adding additional to the site incrementally. The design presented cost estimates, and showed a phased approach on how to extend utilities to the site. Moving forward, Ms. Tinney will reach out to the prospective developer and let them know that the IDA has reviewed this potential site plan and is interested in moving forward on developing this site. She will also get more information from the developer about the specific types of industry that are interested in occupying these buildings once built.

James Gensel, Fagan Engineers & Land Surveyors, PC

Mr. Gensel addressed the board regarding the Owego Gardens II water contracts. He explained the challenges surrounding the contract with Robinson, and the current activities that are occurring at the site. Mr. Gensel also reported that there are two change orders with Robinson's Contract "A:" change order #2 in the amount of \$1,813, and change order #3 in the amount of \$7,459. Lastly, Mr. Gensel informed the board that there will be a change to the Suez credit that the IDA will receive. The original expected credit from Suez was approximately \$110,000, with the new expected credit being between \$260,000-\$270,000.

Motion to approve change order #2 in the amount of \$1, 813 and change order #3 in the amount of \$7,459 to the Robinson contract. (K. Gillette, M. Sauerbrey)

Aye-5	Abstain-0
No-0	Carried

IV. Approval of Minutes

A. August 4, 2021 Regular Meeting Minutes

Motion to approve August 4, 2021 Regular Board Meeting Minutes, as written. (J. Ward, K. Gillette)

Aye-5	Abstain-0
No-0	Carried

V. Financials

A. Balance Sheet

- B. Profit & Loss
- C. Transaction Detail Motion to acknowledge financials, as presented. (J. Ward, T. Monell)

VI. ED&P Update: L. Tinney

Ms. Tinney updated the board on two items:

- 1. Ithaca Neighborhood Housing Services (INHS) project on Temple and Liberty Streets in the Village of Owego continues to move forward. The project will go to the County Planning Board, Village of Owego Planning Board and Village of Owego Zoning Board for review later this month.
- Education Workforce Coordinator: Interviews for this position will be conducted tomorrow. Ms. Tinney also mentioned that they have submitted a resolution to the County Legislature this month to hire a part time employee.

VII. Project Updates: L. Tinney & C. Curtis

- A. Owego Gardens II
 - 1. Updated Project Cost Spreadsheet

Ms. Curtis reported that she has updated the spreadsheet to reflect the change orders discussed earlier in the meeting by Mr. Gensel, and the increase to the Suez credit as discussed earlier.

VIII. Committee Reports: C. Curtis

A. Public Authority Accountability Act (PAAA)

- 1. Audit Committee Report: A. Gowan, E. Knolles, J. Ward a. No report
- 2. Governance Committee: J. Ceccherelli, A. Gowan, E. Knolles a. Annual Employee Review
- 3. Finance Committee: J. Ceccherelli, A. Gowan, J. Ward a. No report
- 4. Loan Committee: S. Thomas, A. Gowan, R. Kelsey, K. Dougherty, D. Barton, J. Ward, E. Knolles
 - a. No report
- 5. Railroad Committee: M. Sauerbrey, K. Gillette, T. Monell a. No report

IX. PILOT Updates: C. Curtis

A. Sales Tax Exemptions Update:

- 1. Owego Gardens II Home Leasing \$29,633.49/Authorized \$524,194
- 2. RB Robinson \$4,605.77/Authorized \$55,990
- B. School & Village PILOT invoices distributed

X. Grant Updates: C. Curtis

A. Monkey Run FEMA Application – Approved – Total Project Cost \$28,316.26; Awarded Federal Share \$21,237.20; Awarded State Share \$3,539.53; TCIDA Match \$3,539.53

1. JB's Excavation completed project

B. New York State Division of Homeland Security and Emergency Services (DHSES) DR-4567

Planning Grant – Richford Railroad 1. Application in progress

 Motion to move into Executive Session pursuant to Public Officers Law Section 105 at 5:32 pm to discuss financial matters, property acquisitions, and personal matters. (K. Gillette, T. Monell) Motion to adjourn Executive Session at 5:45 pm.

NOTICE OF EXPANDED LEGAL OBLIGATIONS UNDER NYS PREVAILING WAGE LAWS

The New York State Department of Labor (DOL) would like to take this opportunity to apprise all state and local government agencies of the most recent expansion of our prevailing wage laws that will encompass certain construction projects performed under private contract that receive public subsidies. <u>We are seeking your cooperation and partnership toward ensuring compliance with this new law</u>.

New York Labor Law 224-a (<u>https://codes.findlaw.com/ny/labor-law/lab-sect-224.html</u>) takes effect January 1st 2022, at which point construction projects throughout the state whose total costs exceed \$5 million and for which at least 30% of these costs are met through use of public subsidies, including grants, tax incentives, loans, credits, and other public monies, will be subject to applicable prevailing wage laws:

- Developers, owners, or contractors of any such project will be subject to comply with the applicable provisions in NY Labor Law 220, Article 8.
- All employees on covered projects must be paid the applicable prevailing wages rates and supplements. DOL's standard procedures for obtaining a wage schedule should be followed (<u>https://apps.labor.ny.gov/wpp/showPublicNewProject.do?method=showlt</u>)
- The submission of a certification and attestation that we will provide must also be submitted to DOL when applying for the required wage schedule.

We are requesting that you provide the DOL contact information for the appropriate representative from your agency by **October 4th**. Please send this information to us at <u>Ask.PWAsk@labor.ny.gov</u>. We will be following up with your agency in the coming weeks with additional details pertaining to compliance with this new law. DOL'will begin enforcing this law upon implementation. For any questions or to discuss further, please contact Jonathan Jones (Jonathan.Jones@labor.ny.gov).

Thank you in advance for you anticipated cooperation.

Milan Bhatt Deputy Commissioner for Worker Protection New York State Department of Labor

Aaron Gowan	voting	
Tracy Monell	voting	
Jonathan Ward	voting	
Eric Knolles	voting	

The foregoing Resolution was thereon declared duly adopted.

STATE OF NEW YORK:

: ss.: COUNTY OF TIOGA :

I, the undersigned Secretary of the Tioga County Industrial Development Agency (the "Agency"), do hereby certify that I have compared the foregoing extract of the minutes of the meeting of the members of the Agency, including the Resolution contained therein, held on October 6, 2021 with the original thereof on file in my office, and that the same is a true and correct copy of said original and of such Resolution set forth therein and of the whole of said original so far as the same relates to the subject matters therein referred to.

I FURTHER CERTIFY that (A) all members of the Agency had due notice of said meeting; (B) said meeting was in all respects duly held; (C) pursuant to Article 7 of the Public Officers Law (the "Open Meetings Law"), said meeting was open to the general public, and due notice of the time and place of said meeting was duly given in accordance with such Open Meetings Law; and (D) there was a quorum of the members of the Agency present throughout said meeting.

I FURTHER CERTIFY that, as of the date hereof, the attached Resolution is in full force and effect and has not been amended, repealed or rescinded.

IN WITNESS WHEREOF, I have hereunto set my hand and affixed the seal of the Agency this _____ day of _____, 2021.

Martha Sauerbrey Secretary

(SEAL)
